

NGLS DESIGN STUDY AND ACCELERATOR R&D

John Corlett for the NGLS Accelerator Systems Team

March 15, 2012

What is the NGLS?

Why do we need it – now?

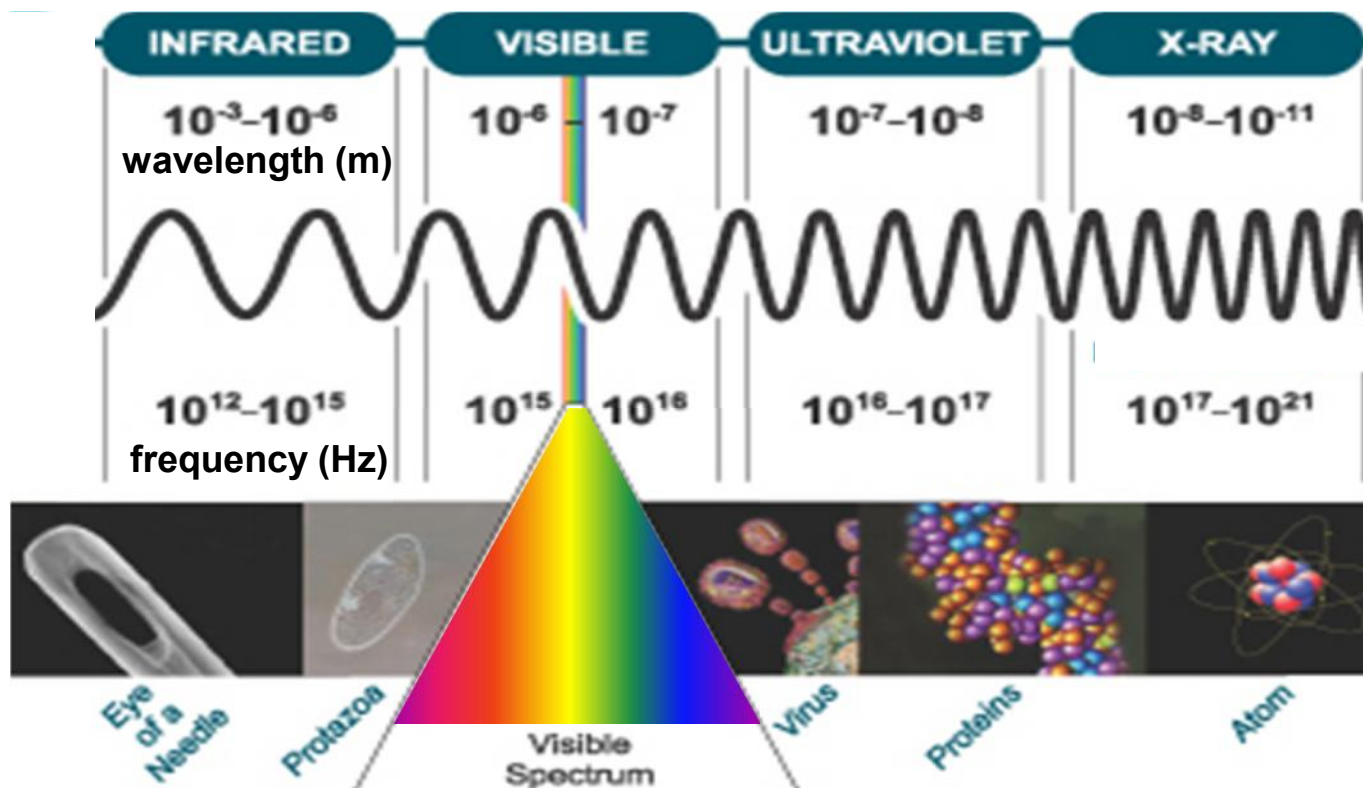

NGLS will be the world's fastest

- High repetition rate **X-ray laser** with **ultrafast**
- Significant impact on the DOE mission
 - Urgent energy science: photosynthesis
- Unique machine that will enable global leadership in critical areas
- Recent X-ray laser breakthroughs (LCLS/FLASH/FERMI@elettra) point the way...
- Ten year time horizon, NGLS is not an incremental advance

Worldwide, no source – operating today or under construction – will be able to provide all the capabilities of NGLS

Light – Electromagnetic Spectrum

Ultrafast Phenomena

1 fs is to 1 second

Electron motion in atomic levels

Three generations of light sources have driven X-ray science:

Next generation sources will be *intense, ultrafast, coherent*

Synchrotron radiation from accelerated electron beams

What is the NGLS? – Technologies

Goal: beams of intense, ultrafast, coherent X-ray pulses at high repetition-rate

Free electron lasers (FELs) provide intense, ultrafast, coherent, X-ray pulses

A superconducting accelerator and high rep-rate injector provides high brightness electron beam

Comparison with existing light sources

NGLS Capabilities

High repetition rate soft X-ray laser array

- Up to 10^6 pulses per second
- Average coherent power up to ~ 100 W

Spatially and temporally coherent X-rays (seeded)

- Ultrashort pulses from 250 as – 250 fs
- Narrow energy bandwidth to 50 meV

Tunable X-rays

- Adjustable photon energy from 280 eV – 1.2 keV
 - higher energies in the 3rd and 5th harmonics
- Polarization control
- Moderate to high flux with 10^8 – 10^{12} photons/pulse

Expandable

- Capability
- Capacity

NGLS Approach

High average power electron beam distributed to an array of FELs from high rep-rate injector and CW SCRF linac

NGLS offers significant advances over current capabilities:

- More photons per unit bandwidth
- More photons per second
- Shorter pulses
- Controlled trade-off between time and energy resolution

Three initial FEL beamlines to span the science case

High resolution
~Time-bandwidth limited
 $10^{11} - 10^{12}$ ph/pulse
 $10^{-3} - 5 \times 10^{-5}$ bandwidth

High-resolution spectroscopy
Diffract-and-Destroy
(with harmonics)

Ultra-fast
Sub-fs pulses
2 color
 10^8 ph/pulse

Multidimensional spectroscopy

Highest rep rate
High flux
 $10^{11} - 10^{12}$ ph/pulse
100 W

Diffract-and-Destroy
(at highest rate)
Photon correlation spectroscopy

Broad Range of Energy Science Uniquely Enabled by NGLS

Natural and Artificial Photosynthesis

Fundamental Charge Dynamics

Advanced Combustion Science

Catalysis

Nanoscale Materials Nucleation

Dynamic Nanoscale Heterogeneity

Quantum Materials

Nanoscale Spin and Magnetization

Bioimaging: Structure-to-Function

NGLS - What Does it Do?

- High repetition rate X-ray laser with ultrafast pulses
- NGLS will probe the *motion* of molecules, atoms, and electrons
- On their natural time scales – femtoseconds (fs) and faster....
- With unprecedented resolution
 - *nanometers (molecules) to Angstroms (atoms)*
- With chemical sensitivity – Carbon, Oxygen, Nitrogen.....

Time to do Experiments - Photosynthesis

Required	10^{17}	photons
Damage Limit	10^8	ph/pulse
Max Rep. Rate	10^5	Hz

Sample Replacement:
 10^5 Hz

Time to do experiment:

$\text{Photons Required} / (\text{Photons/Pulse} \times \text{Rep. Rate})$

	Source (<i>intrinsic</i>)		Time to do experiment		Time resolution
	Max. ph/pulse	Max. Rep. rate [Hz]			
Storage Ring	10^5	5×10^8	$10^{17}/10^5/10^5$	100 days	100 ps
Pulsed FEL	10^{10}	10^2	$10^{17}/10^8/10^2$	100 days	~fs
NGLS	10^9	10^6	$10^{17}/10^8/10^5$	3 hours	~fs

NGLS CD-0 Proposal

- Submitted December 2010
- More than 150 contributors
- Representing >40 national and international research institutions

NGLS project status

- LBNL submitted a CD-0 proposal in December 2010
- DOE approved “Mission Need” for the Next Generation Light Source
- Currently no DOE budget to pursue a Project
- LBNL is
 - Fully committed to NGLS
 - Performing Accelerator and Detector R&D
 - Performing feasibility studies which will inform a Conceptual Design

The Deputy Secretary of Energy
Washington, DC 20585

April 5, 2011

MEMORANDUM FOR WILLIAM F. BRINKMAN
DIRECTOR
OFFICE OF SCIENCE

FROM: DANIEL B. PONEMAN 

SUBJECT: Approval of Critical Decision-0 for the Next Generation Light Source

In accordance with Department of Energy Order 413.3B, *Program and Project Management for the Acquisition of Capital Assets*, the Next Generation Light Source project has met Critical Decision (CD)-0 (Approve Mission Need) requirements. As the Secretarial Acquisition Executive, based on the recommendation of the Energy Systems Acquisition Advisory Board, I approve CD-0. The rough order of magnitude cost range is \$0.9 billion to \$1.5 billion.

Please continue to work with the Office of Engineering and Construction Management as you progress to Critical Decision-1 (Alternative Selection and Cost Range).

Sean Lev GC-1
Associate Director, Office of Basic Energy Sciences, SC-22
Director, Office of Project Assessment, SC-28

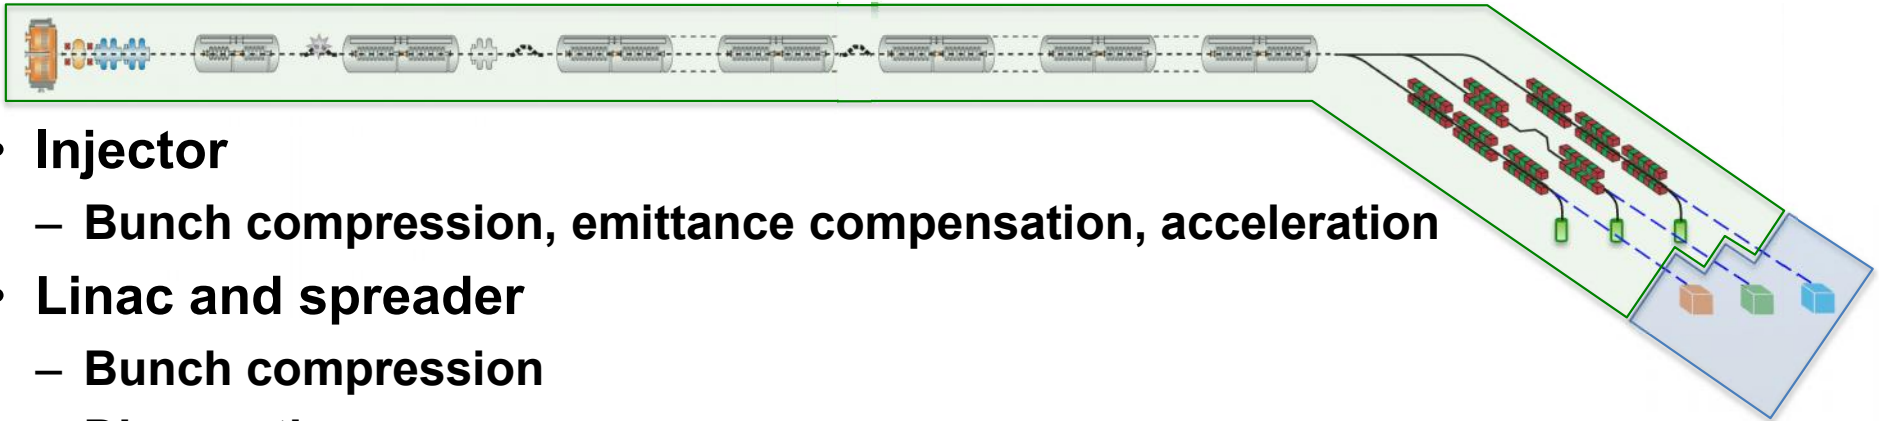

Science requirements drive machine design

- Tuning range
- Maximum photon energy
- Peak flux
- Average Flux
- Repetition rate
- Two-color capability
- Pulse duration
- Bandwidth
- Accuracy
- Stability
- Synchronization
- Contrast ratio

Work in progress to better define the machine layout

- **Injector**
 - Bunch compression, emittance compensation, acceleration
- **Linac and spreader**
 - Bunch compression
 - Diagnostics
 - Cryomodules, accelerating gradient, cavity quality factor, field emission, higher-order-mode power
 - Collimation
 - Kicker and septum magnets, spreader transport lattice
- **FEL design**
 - Undulators
 - Seeding
- **Beam dumps**

Undulator radiation

Over one undulator period, the electron is delayed with respect to the light by one optical wavelength

$$I_{x-ray} = \frac{I_{undulator}}{2g^2} \approx \frac{K^2}{2} \frac{1}{g^2}$$

$$K = \frac{eB_0 l_{undulator}}{2\pi mc}$$

FEL bunching

Microbunching: electrons losing energy to light travel a longer distance than electrons gaining energy from the light

FEL gain

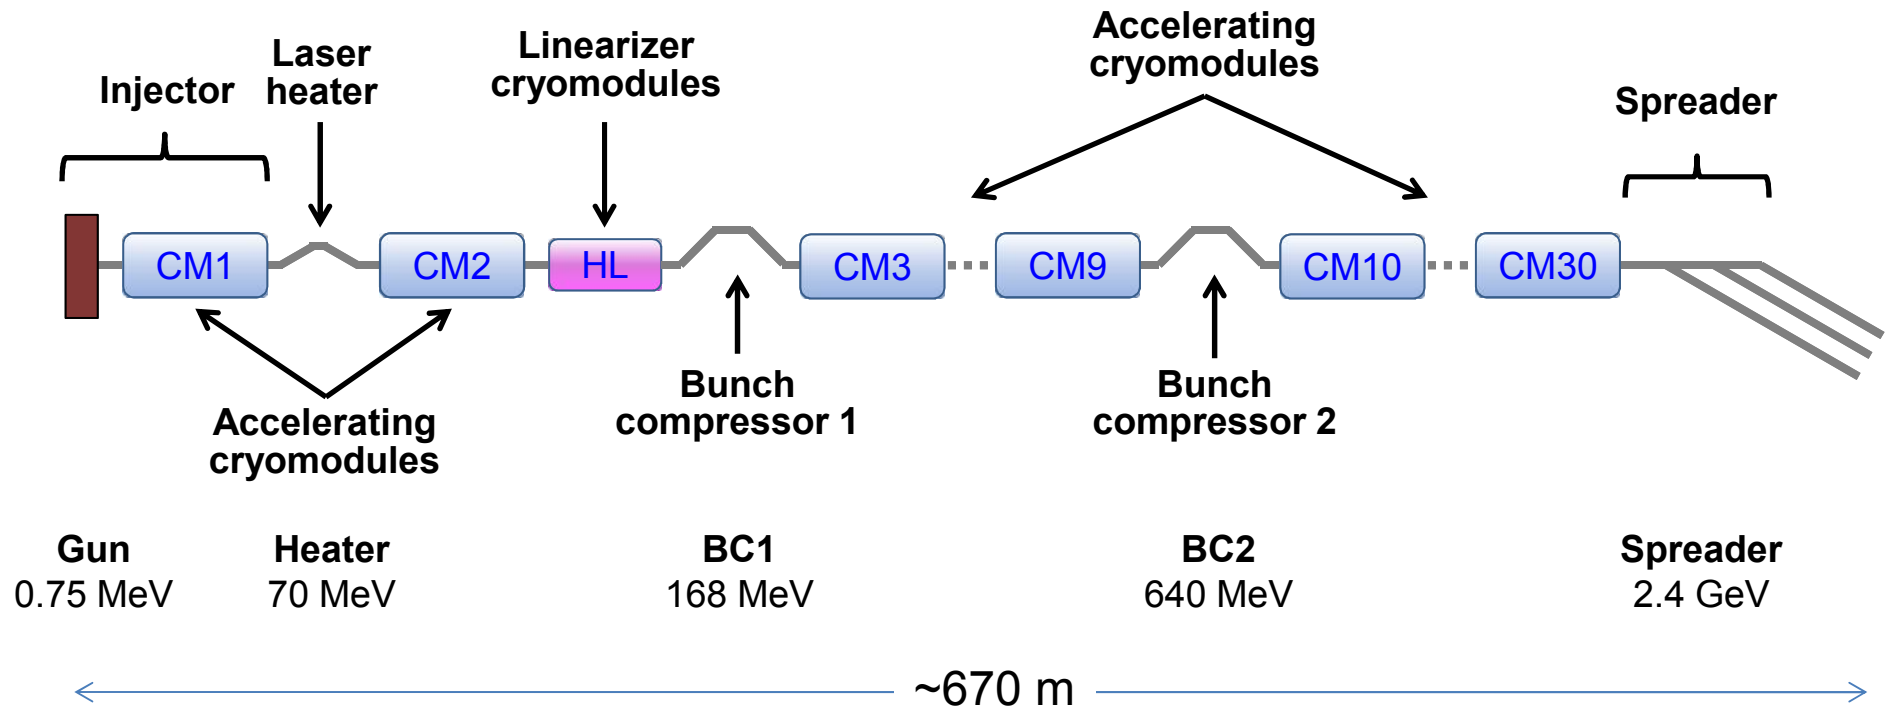

The particles within a microbunch radiate like a single particle of high charge

The resulting strong radiation field enhances the microbunching even further and leads to an exponential growth of the radiation power

Linac schematic layout

Injector multivariate optimization

Beam dynamics modeling through linac

- Two-stage compression
- 2.4 GeV
 - APEX-gun generated beams (300pC)
 - ≥ 600 A peak current and small residual energy chirp within usable beam core
 - limited CSR-induced projected emittance growth

Twiss functions through the Linac

Longitudinal beam phase-space at entrance of FEL beamlines*

This part of the bunch lases

*Elegant simulation through the linac starting from an ASTRA-simulated beam out of the APEX-gun based injector

Physics & technology challenges

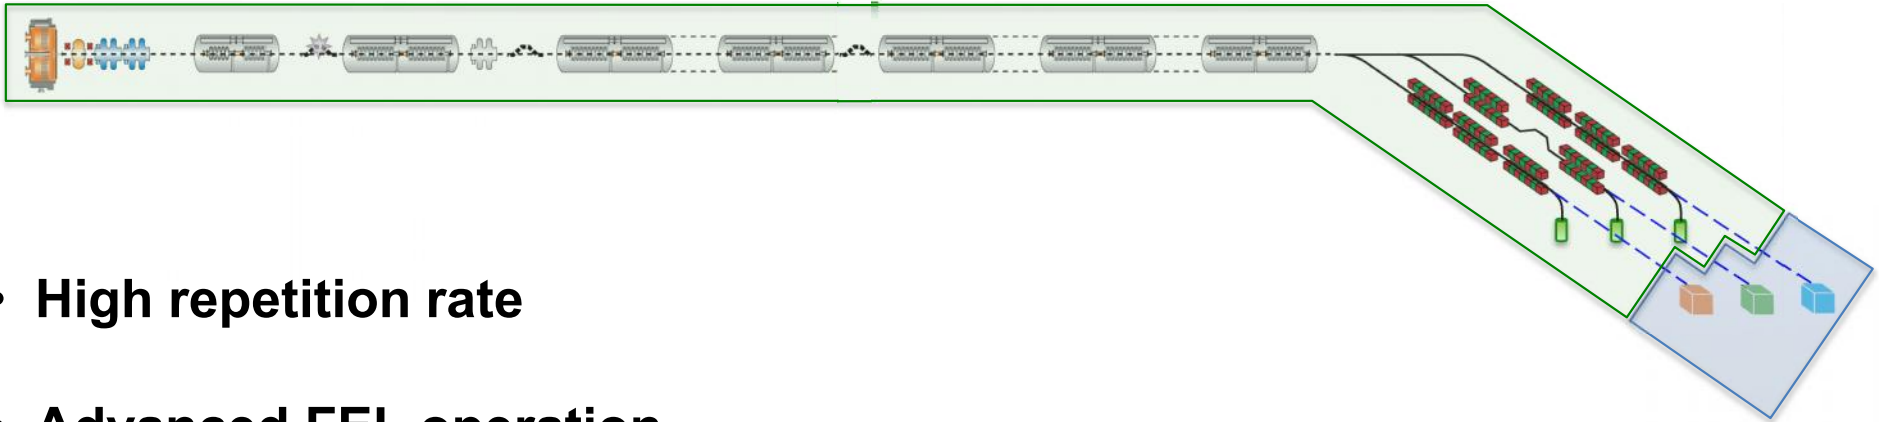

- Transverse phase space
 - Small electron beam emittance ε
- Longitudinal phase space
 - Large peak current I_{peak}
 - Small energy spread σ_E
- Electron beam energy γ
 - High gradient accelerator
- Short period undulators
- Collective effects
- Average power
 - High repetition rate injector
 - CW superconducting accelerator
- X-ray temporal control
 - FEL design & seeding techniques

$$\frac{e_n}{g} \gg \frac{I_{x-ray}}{4p}$$

$$\text{Power/undulator length} \sim f \frac{\partial}{\partial t} I_{peak}, \frac{e_n}{g}, S_E \frac{\ddot{C}}{\ell}$$

$$I_{x-ray} = \frac{I_{undulator}}{2g^2} \frac{\partial}{\partial t} + \frac{K^2 \ddot{C}}{2\ell}$$

Accelerator Systems R&D

- High repetition rate
- Advanced FEL operation
- High average power
- Superconducting accelerator developments

Injector design goals – APEX gun

- Repetition rate 1 MHz
- Charge per bunch from ~ 10 pC to ~ 1 nC
- Emittance $< 10^{-6}$ mm-mrad (normalized)
- Electric field at the cathode $\geq \sim 10$ MV/m (space charge emission limit)
- Beam energy at the gun exit $\geq \sim 500$ keV (space charge control)
- Bunch length ~ 100 fs to ~ 10 ps for handling space charge effects, and for allowing different modes of operation
- Compatible with magnetic field control within the gun (emittance exchange and compensation)
- 10^{-11} Torr vacuum capability (cathode lifetime)
- Accommodates a variety of cathode materials
- High reliability for user operations

*The gun is the most challenging component
LBNL approach uses a CW VHF cavity*

APEX gun

VHF cavity operates in CW mode

- Low power density on cavity walls
- High conductance vacuum slots
- High gradient at cathode

Frequency	187 MHz
Operation mode	CW
Gap voltage	750 kV
Field at the cathode	19 MV/m
Q_0	30887
Shunt impedance	6.5 M Ω
RF Power	90 kW
Stored energy	2.3 J
Peak surface field	24 MV/m
Peak wall power density	25 W/cm ²
Accelerating gap	4 cm
Diameter/Length	70/35 cm
Operating pressure	< 10 ⁻¹¹ Torr

APEX gun in test area

- APEX cavity is successfully RF conditioned

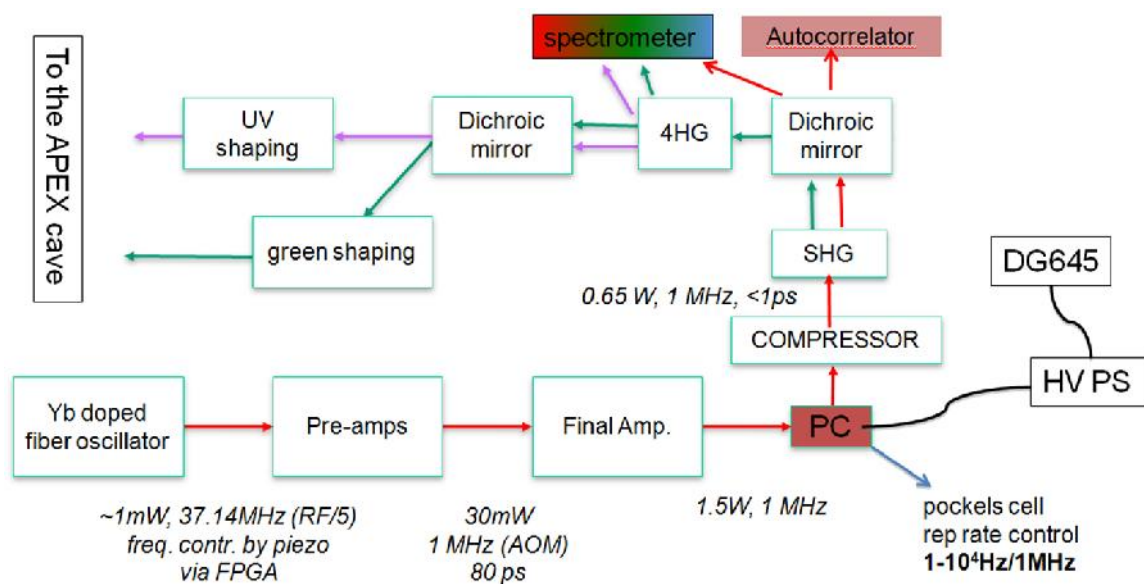

APEX in the Beam Test Facility

Yb fiber photocathode drive laser

- 1 MHz replate Yb fiber laser
 - LLNL/UCB/LBNL collaboration

Photocathode materials

Alkali Antimonides eg. K_2CsSb

- Fast
- Reactive; requires UHV $\sim 10^{-10}$ Torr pressure
- High QE (typically $>5\%$)
- No pulse charge saturation
- Requires green light (532 nm, 2nd harm. conversion from IR)
- For 1 nC & 1 MHz rep-rate, ~ 1 W IR required
- Unproven lifetime at high rep-rate and high average current

Cs_2Te (developed by INFN/LASA and delivered to LBNL)

- Fast
- Relatively robust and un-reactive ($\sim 10^{-9}$ Torr)
 - Demonstrated in a high gradient rf gun
- High QE (typically $>5\%$)
- No pulse charge saturation
- Requires UV 250 nm, 3rd or 4th harm. from IR laser)
- For 1 nC - 1 MHz replate, ~ 10 W IR required
- Unproven at high rep-rate and high average current

Photocathode materials R&D

K_2CsSb :

6% QE at 532 nm

0.36 microns / mm rms ϵ_n

>> 1 week lifetime

APEX stages

Phase I:

Beam
characterization
at gun energy
(750 keV)

Phase 0:

Gun and
photocathode
tests

Phase-II:

Beam characterization at 15–30 MeV

- 6-D brightness measurements

*Diagnostics systems in
collaboration with Cornell
CLASSE*

*Accelerating cavities in
collaboration with ANL AWA*

- **Planning for final installation in 2013**

Accelerating structures

Normal conducting

- High power dissipation in structure walls
 - Operate in pulsed mode for highest gradient
 - E.g. 120 Hz SLAC linac (2.9 GHz)
 - $\sim 20 \text{ MVm}^{-1}$

Superconducting

- Capability to operate CW at high gradient
 - Options for beam recirculation and energy recovery
 - 20 MVm^{-1} a goal for CW operations
 - CEBAF 12 GeV upgrade

A superconducting accelerator is efficient for high repetition-rate beam

$$R_S = \frac{A}{T} f^2 e^{-\frac{D(T)}{kT}} + R_0$$

	Superconducting	Normal conducting
Q_0	2×10^9	2×10^4
Power loss (W/m) [@ 1 MV/m, 500 MHz]	1.5	56,000
Wall-plug power (kW/m) [@ 1 MV/m, 500 MHz]	0.54	112

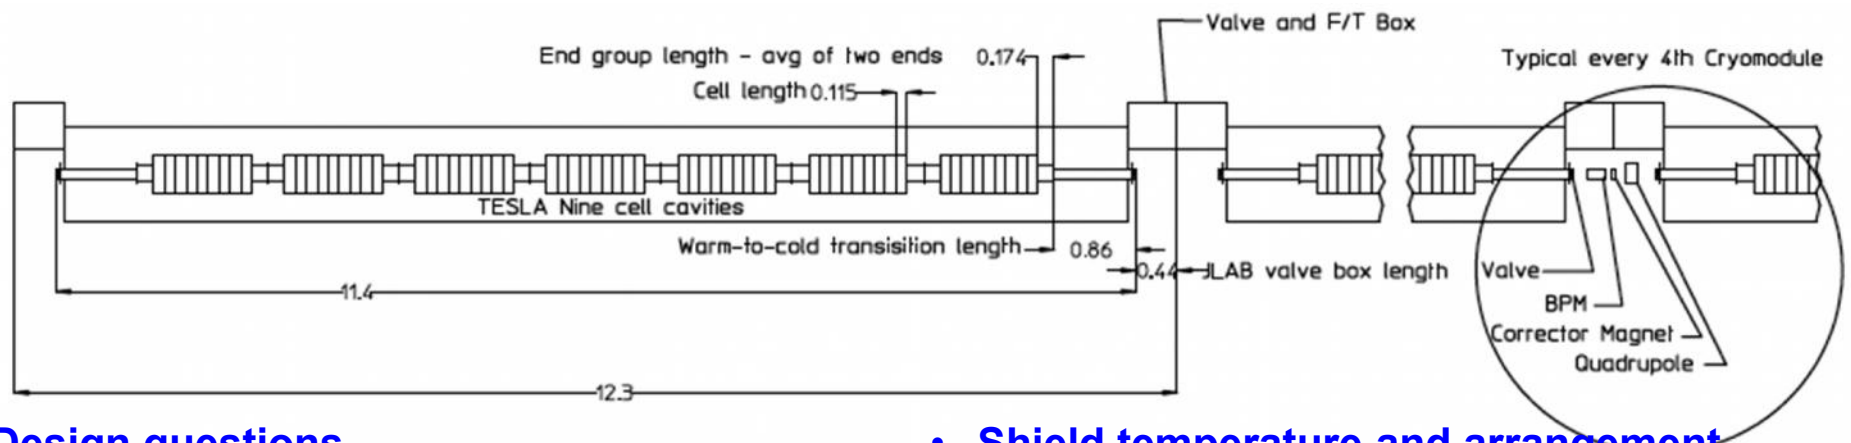

Power requirement reduced by ~200

SCRF cryomodules are mature technology

NGLS cryomodule concept

- Current cryomodule concept uses “TESLA” cavities in JLAB-style housing
 - Cold/warm transitions on each cryomodule
 - Distribute 5 K liquid, cool to 1.8 K at cryomodule
 - Warm magnets & diagnostics

Design questions

- Operating gradient increased to ~16 MV/m
- $Q_0 \geq 2 \times 10^{10}$
- HOM power dissipation and absorption
- Field emission
- Number of cavities within a single module
- Shield temperature and arrangement
- Power coupler design
- Tuner type and access
- Selection and sizing of cryogenic circuits
- Minimization of acoustic noise
- Warm to cold transitions

Cryomodules (harmonic cavities)

- Fermilab cryomodules installed at FLASH
 - Modify for CW operation?

TM₀₁₀ Cavity

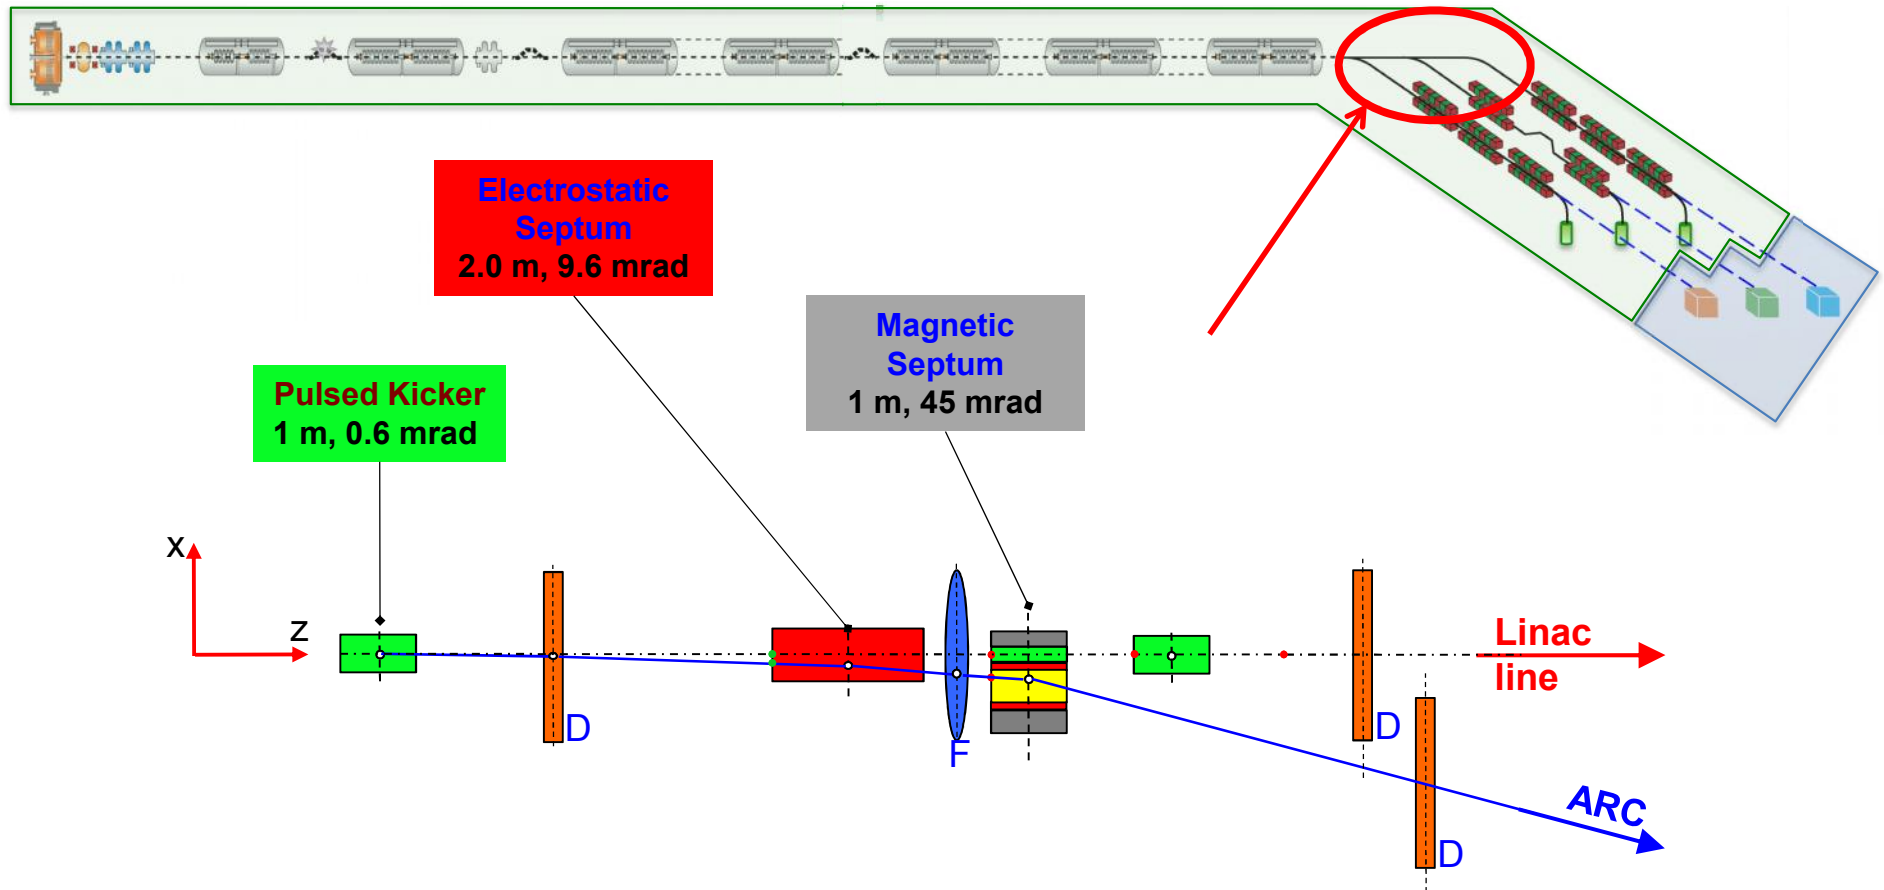

Parameter List for 3.9 GHz cavity:

Number of cavities	4
Active Length	0.346 m
Gradient	14 MV/m
Phase	-179 deg
R/Q	375 Ω
E _{peak} / E _{acc}	2.26
B _{peak} (E _{acc} =14 MV/m)	68 mT
Q _{ext}	9.5·10 ⁵
BBU threshold, Q	<1.e+5
Total energy	20 MeV
Beam current	9 mA
Forward Power	11.5 kW
Power in Coupler	45 kW

- Decreased surface fields in end cells
- Regular cells -30mm iris diameter
- End-cells iris from the tube side increased up to 40mm for better coupling with the power coupler
- Two HOM couplers are mounted in both ends
- Ports for power coupler and pick-up antenna
- 2.8 mm bulk niobium

Optimizing the beam spreader

- Electrostatic septum allows 5x weaker kickers (1/5 stability tolerance)
- Footprint reduced $\sim 1/3$

The FEL undulators are large arrays of precision magnets

Undulator technology

- Currently undulator technology limits period 15 mm
- Requires beam energy ~2 GeV to radiate at 1 nm
- Superconducting devices could provide significant performance improvements
 - R&D projects under way to develop short-period undulators using Nb₃Sn

$$I_{x\text{-ray}} = \frac{I_{\text{undulator}}}{2g^2} \frac{\hbar}{\hbar} + \frac{K^2}{2} \frac{\hbar}{\hbar}$$

$$K = \frac{eB_0 l_{\text{undulator}}}{2\rho mc}$$

SPring-8 Compact SASE Source

Superconducting undulator R&D

Cryostat for test and measurement

Seeded FELs - 1

Wiggler period

Undulator parameter

$$I_w = 2g^2 I_L / (1 + \frac{K^2}{2})$$

Laser wavelength

- Electron beam couples to E-field of laser when co-propagating in an undulator
- Over one undulator period, the electron is delayed with respect to the light by one optical wavelength

Seeded FELs - 2

Self-seeded FELs

LCLS Hard X-ray Self Seeding – demonstrated at 1.5 Å

Initial results: 40x reduction in BW (40x increase in peak brightness)

Self-seeded FELs

LCLS Soft X-ray Self Seeding – in planning stages

High-gain harmonic generation (HGHG)

$$I_{\text{laser}} = I_{\text{modulator}} = \frac{I_{\text{modulator}}}{2g^2} \left(1 + \frac{K^2}{2} \right)$$

$$I_{\text{radiator}} = \frac{I_{\text{modulator}}}{n} = \frac{I_{\text{radiator}}}{2g^2} \left(1 + \frac{K^2}{2} \right)$$

$n \sim \text{a few to } \sim 10$

FERMI@elettra demonstrates HGHG at $\sim 10^{\text{th}}$ harmonic (~ 20 nm)

- UV laser seed (~ 200 nm)
- FEL gain at 20 nm
- 4 nm FEL cascade under construction

FEL photon energy ~ 38 eV
Photon energy fluctuations = 1.1 meV (RMS)
FEL bandwidth = 5.9×10^{-4} (RMS)
FEL bandwidth fluctuations = 3% (RMS)

Enrico Allaria

Laser seeded FELs – ECHO

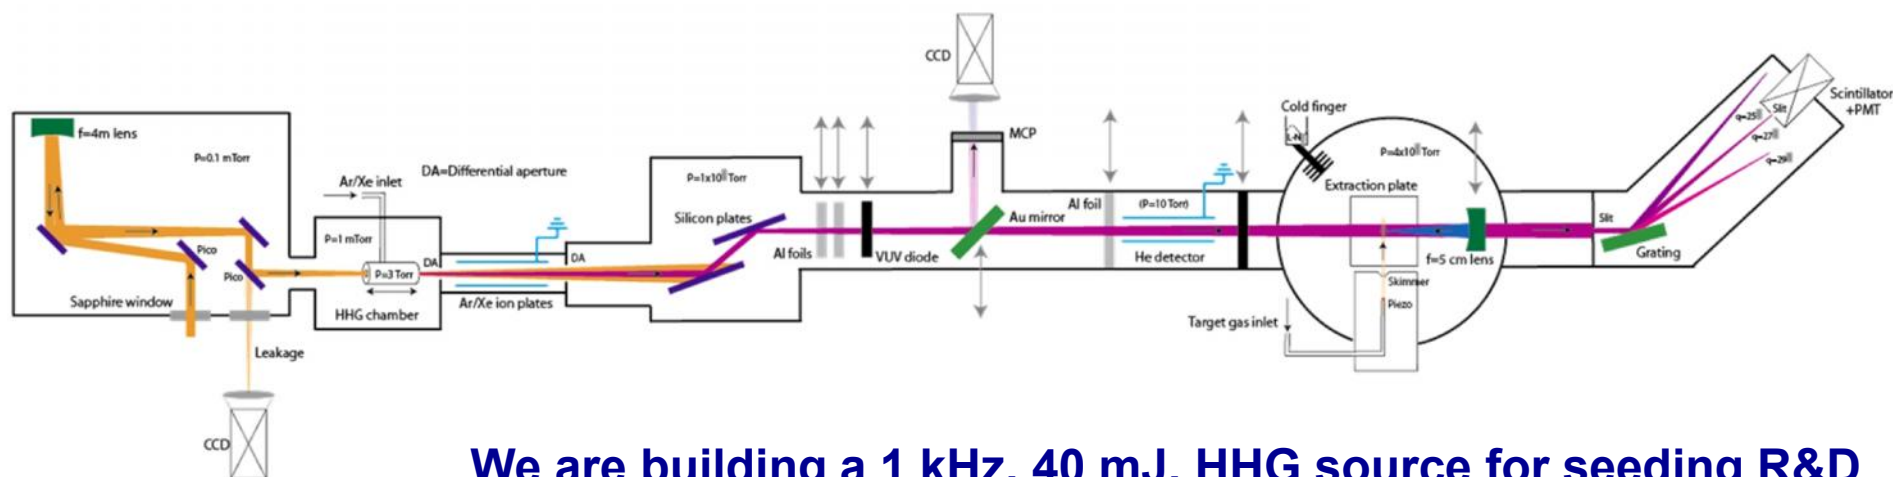

- Developing R&D plans
 - Beam experiments
 - Laser developments
- EEHG
HHG
HGHG

Stupakov, G., *Using the Beam-Echo Effect for Generation of Short-Wavelength Radiation*, Physical Review Letters **102** (2009) 074801

HHG seeded FEL R&D

- HHG seeding at 50 – 100 eV
- HHG seeding demonstrated at 61.5 nm (SCSS)
- Harmonic generation in FEL to reach 1 nm

We are building a 1 kHz, 40 mJ, HHG source for seeding R&D

NGLS at the LBNL site

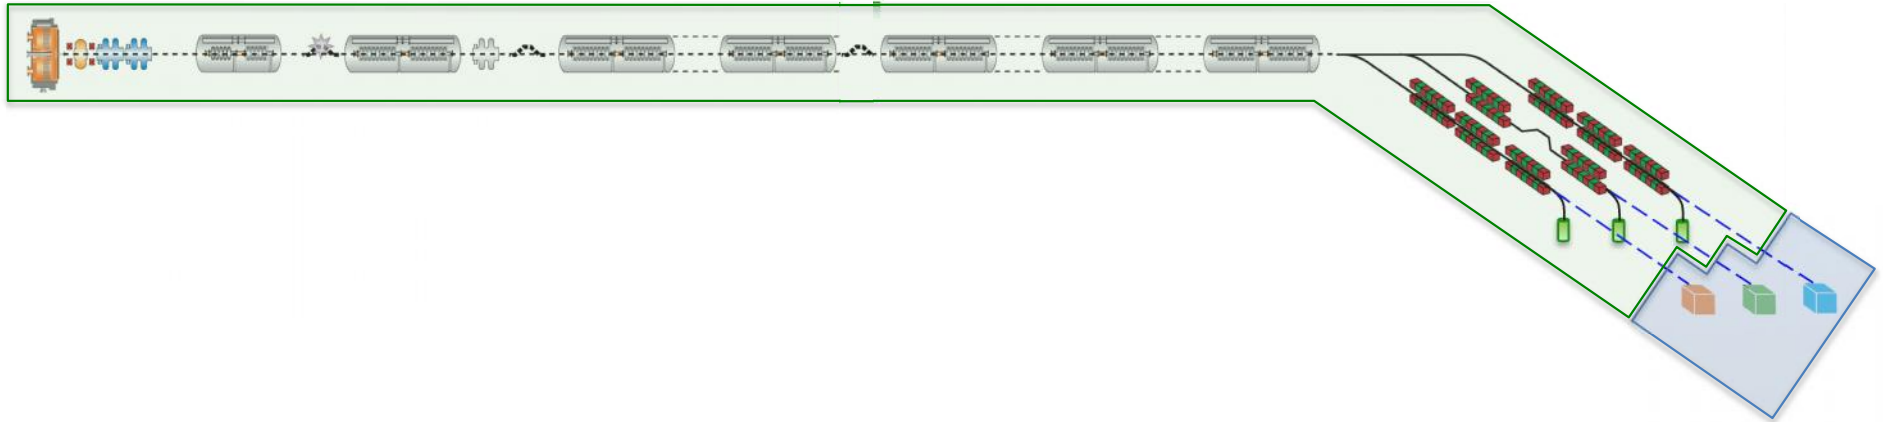

Summary

- **DOE has approved Mission Need for a Next Generation Light Source**
 - **LBNL led the effort**
 - **We are:**
 - **Developing science case and experimental requirements**
 - **Optimizing machine design to best meet science needs**
 - **Executing and developing R&D plans**
 - **Strengthening and building collaborations**
 - **Seeking partnership with FNAL**
 - **Expertise in SCRF and cryosystems**

Summary schedule (for planning purposes)

New era in X-ray Science: Nobel Prizes for X-rays and lasers portend the future scientific impact of true X-ray lasers

Nobel Prizes – Laser Related

1964: Townes, Basov, Prokhorov
1971: Gabor
1981: Bloembergen, Schawlow
1997: Cohen-Tannoudji, Chu, Phillips
1999: Zewail
2000: Alferov, Kroemer
2001: Cornell, Ketterle, Wieman
2005: Hansch, Hall

Nobel Prizes – X-ray Related

1901: Röntgen
1914: von Laue
1915: Bragg, Bragg
1917: Barkla
1924: Siegbahn
1927: Compton
1936: Debye
1962: Perutz, Kendrew
1962: Crick, Watson, Wilkins
1964: Hodgkin
1976: Lipscomb
1979: Cormack, Hounsfield
1981: Siegbahn
1985: Hauptman, Karle
1988: Deisenhofer, Huber, Michel
1997: Boyer, Walker
2006: Kornberg
2009: Ramakrishnan, Steitz, Yonath

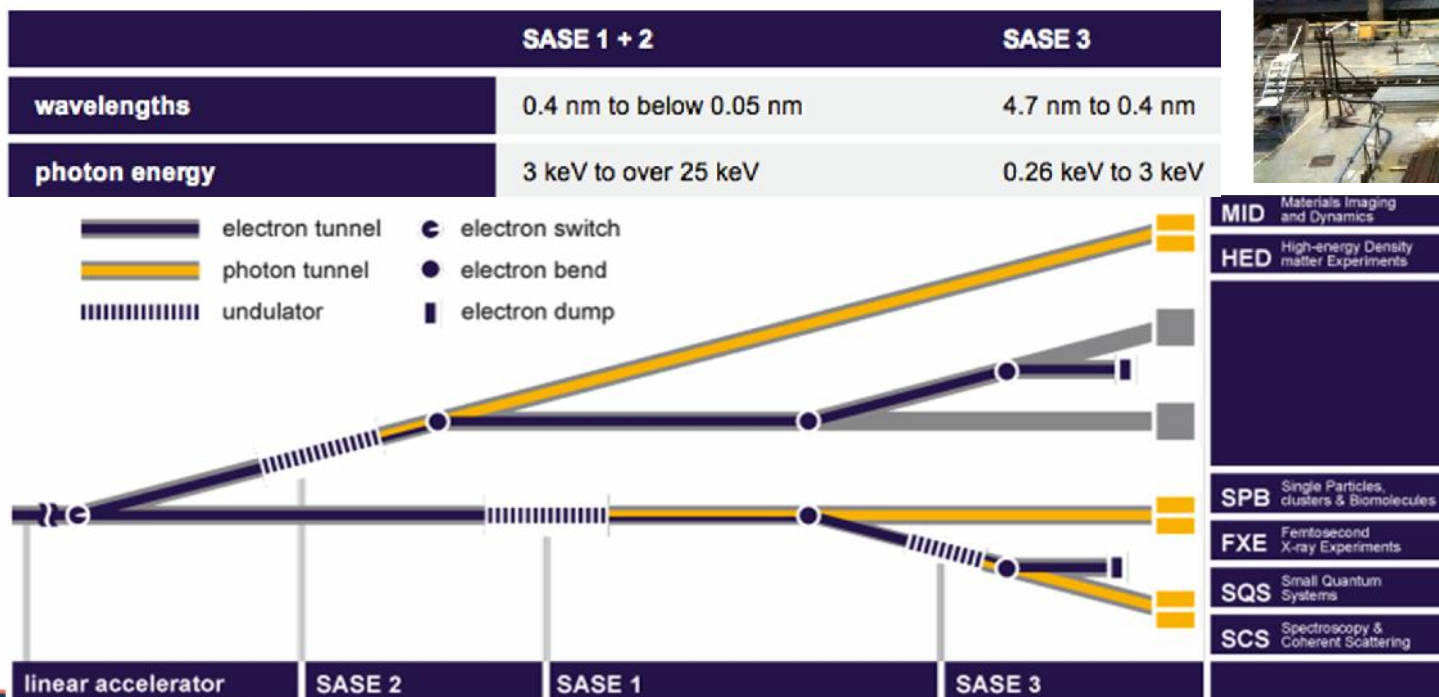

X-ray lasers and X-ray science are developing rapidly

- Superconducting linac
- 30 kHz (burst mode)
- Soft and hard X-rays
- Operational in 2015

Experimental Hall

X-ray lasers and X-ray science are developing rapidly

World's first seeded X-ray FEL – tunable in soft x-ray range

- UV laser seed (200 nm)
- FEL gain at 20 nm
- 1 nm FEL under construction

FEL photon energy ~ 38 eV
Photon energy fluctuations = 1.1 meV (RMS)
FEL bandwidth = $5.9e^{-4}$ (RMS)
FEL bandwidth fluctuations = 3% (RMS)

ITALY

Upgrade of FLASH – World's first X-ray FEL

Superconducting
- Potential for CW operation)

FLASH-II
- Tunable (adjustable undulators)
- Seeded (coherent)

GERMANY

APEX Phase 0

- Demonstration of gun RF performance
- Demonstration of vacuum performance with RF power
- Dark current characterization
- Cathode physics (lifetime, QE, intrinsic emittance) at full repetition rate

APEX Phase I adds diagnostics

- Beam dynamics (6-D measurements)
 - Diagnostics tests
 - Low energy beam characterization
 - **Planned for spring 2012**
- Quadrupole triplet
 - X-Y corrector
 - Retractable slits
 - Deflecting cavity
 - YAG screens
 - Spectrometer

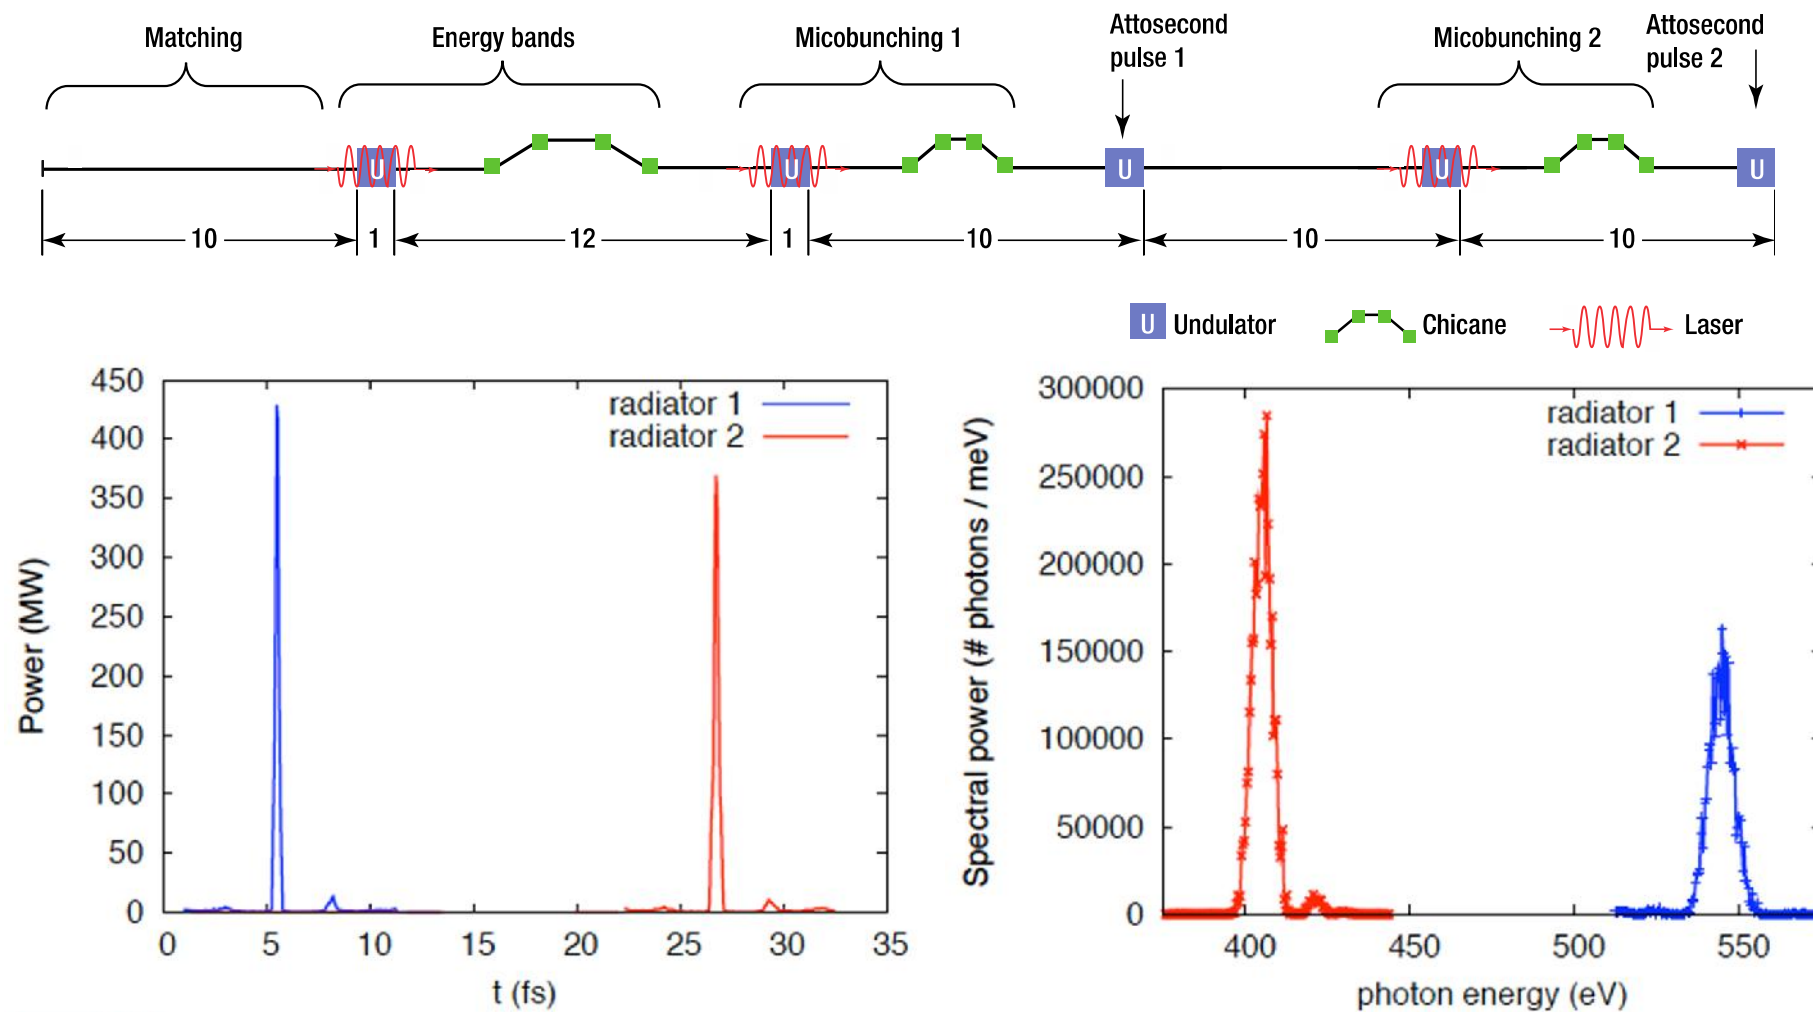

Diagnostics systems in collaboration with Cornell CLASSE

Technical developments since CD-0

- Increased tuning range (1.0 – 4.6 nm)
- Increased beam current (600 A)
- Larger energy spread (100 keV)
- Larger vacuum aperture in undulators (6 mm)
- Longer period undulators (29.4 mm)
- Increased minimum undulator K (1)
- Out-of-vacuum undulators
- Increased average β -function in FEL (15 m)
- Higher beam energy (2.4 GeV)
- Second bunch compressor
- Redesign of spreader including electrostatic septum

ECHO seeded 2-color attosecond

A. Zholents, G. Penn, "Obtaining two attosecond pulses for X-ray stimulated Raman spectroscopy",
 NIM-A, **612**, 2, (January 2010)

FEL harmonics measurements at LCLS

- Now using filters

- Fit to detected signal level with attenuators

$$I \gg I_0 \left(f_1 e^{-I_1 P_1} + f_3 e^{-I_3 P_3} + f_5 e^{-I_5 P_5} + \dots \right)$$

- Future using spectroscopic fast CCD detector
 - LBNL detector

Instrumentation and diagnostics R&D

- **Motivation**
 - Diagnostics to optimize performance, control and feedback systems to stabilize beam
- High-resolution for high-brightness beams
- Large dynamic range for flexible operating modes
- Non-intercepting for high beam power
- High repetition rate
- X-ray beam and electron beam systems
 - Beam position monitors
 - Transverse profile monitors
 - Longitudinal profile monitors
 - Beam energy measurements
 - Beam arrival time monitors
 - Current monitors using toroids
 - Beam loss monitors

SCRF linac power requirements (CD-0)

$$P_{Input} = \frac{P_{Cavity}}{4\beta} \left[\left(1 + \beta + \frac{P_{Beam}}{P_{Cavity}} \right)^2 + \left(2Q_o \frac{\Delta f}{F_{RF}} \right)^2 \right]$$

$$P_{Cavity} = \frac{V_{Cavity}^2}{Q_o \frac{R}{Q}}$$

$$P_{Beam} = I_{Beam} V_{Cavity} \cos(\gamma_{Beam})$$

RF frequency 1.3 GHz

Cavity tuning excursion ± 25 Hz

$\gamma_{Beam} < 15^\circ$

R/Q 1036 Ω

Cavity length 1.038 m

$Q_o = 1 \times 10^{10}$

$I_{beam} = 1$ mA

- RF power requirement is ~20 kW per cavity
 - 7 cavities per cryomodule \approx 140 kW per linac cryomodule
 - 27 cryomodules
 - 3.8 MW** RF power capacity
 - Dominated by beam power requirement

Timing & synchronization R&D

HGHG demonstrated at Brookhaven SDL

- Spectrum of HGHG and unsaturated SASE at 266 nm under the same electron beam condition
 - Note SASE at saturation would still be order of magnitude lower intensity
